1 Before you start

1.1 General

Thank you for choosing a Dimplex product. We ensure you that every effort has been made at the design, manufacture and delivery stages to produce a product with superior quality. We will provide you with the best possible support throughout the product's lifespan.

As part of ongoing product development and improvement Dimplex reserves the right to undertake changes to the product without prior notice. Great care has been taken to ensure this manual was correct at the time of print. Should you however discover any issues with the information contained therein please do not hesitate to contact your vendor.

We strongly recommend reading the whole contents of this manual before commencing the work.

1.2 Competence

Dimplex products have been designed and manufactured to the current relevant standards and under stringent quality control procedures. It is therefore imperative that the product is only installed by a:

- trained and
- competent

person as defined in the relevant regulations. Dimplex does not accept any liability for damage done to persons or property resulting from undue handling and usage of this product.

All regulations current at the time of installation are to be considered alongside the content of this manual as they form the code of best practice.

The warranty of this product is linked to the ability to prove that the product was installed, commissioned and maintained:

- by a competent person
- in accordance with Dimplex instructions and the current relevant regulations and legislation
- the product being registered with Dimplex at the time of installation using the form in the Dimplex On Site Guide
- records showing the date of maintenance in accordance with the maintenance schedule as detailed in the On Site Guide

1.3 Health and Safety

The installation of this product is subject to the Health and Safety at Work Act. It is your responsibility to ensure that the transport, storage, installation and operation of the product is carried out in a safe manner.

Dimplex will not accept any liability due to damage caused to people or property resulting from negligence or not adhering to the relevant Health and Safety practices.

	Safety precautions: Before commencing mounting work on roofs, it must be ensured in all cases that the non- personal fall protection and fall-arrest systems required by DIN 18338 (Roof Covering and Roof Sealing Works) and DIN 18451 (Scaffolding Works) are in place. See also Builders' Protection Ordinance [Bauarbeiterschutzverordnung], Federal Law Gazette 340/ 1994, paragraphs 7-10! Other country-specific regulations must be observed!		Safety harnesses should be fixed above the users whenever possible. Safety harnesses should only be fastened to sufficiently load-bearing structures or fixing points!
	If non-personal fall protection or fall-arrest systems cannot be installed for technical reasons, all personnel must be secured by means of suitable safety harnesses!		Never use damaged ladders (e.g., wooden ladders with split runners or rungs, or bent or buckled metal ladders). Never try to repair broken runners, rungs or steps on wooden ladders!
	Only use safety harnesses (safety belts, lanyards and straps, shock absorbers, fall arresters) that were tested and certified by authorized testing bodies.		Ensure that ladders are put up safely. Observe the correct leaning angle (68° - 75°). Prevent ladders from sliding, falling over or sinking into the ground (e.g. using wider feet, feet suited to the ground or hooking devices).
	If non-personal fall protection or fall-arrest systems are not provided, working without the use of suitable safety harnesses may lead to falls from heights and therefore cause serious or lethal injuries!		Only lean ladders against secure points. Secure ladders in traffic areas by suitable cordoning.
	Ladders not properly secured against sinking in, sliding or falling over may lead to dangerous falls!		Contact with live electric overhead cables can be lethal.
	<p>Whenever you are near live overhead electric cables where contact is possible, only work if:</p> <ul style="list-style-type: none"> - it is ensured that they are voltage-free and this is secured for the duration of work. - the live parts are secured by covering them or cordoning them off. - the prescribed safety distances are maintained. <p>Voltage radius:</p> <p>1 mvoltages up to 1000V</p> <p>2 mvoltages from 1000V to 11000V</p> <p>3 mvoltages from 11000V to 22000V</p> <p>4 mvoltages from 22000V to 38000V</p> <p>> 5 m in case of unknown voltages</p>		Wear protective goggles when drilling and handling collectors!
			Wear safety shoes when carrying out installation work!
			Wear cut-proof safety gloves when mounting collectors!
	The manufacturer hereby guarantees to take back products identified with an eco-label and to recycle the materials used. Only the heat transfer medium specified may be used!		Wear a helmet when carrying out installation work!

Figure 1: Safety information

1.4 Risk assessment

The compilation of a risk assessment is strongly recommended before installing the product. The following areas require particular consideration in addition to the information required by the Health and Safety at Work Act.

- scalding: where appropriate or required by law a thermostatic mixing valve is to be fitted to the hot water outlet of the cylinder
- explosion: the unit is fully equipped with all relevant safety equipment to comply with current regulations. The correct design and function has been verified by independent third party testing. The correct application thereof is the responsibility of the competent installer.
- water borne organisms (i.e. Legionella): if applicable a risk assessment should be carried out following the recommendations outlined in the Approved Code of Practice L8.
- the user preference must be considered when commissioning the system, in particular when adjusting the solar and auxiliary system temperature and timer settings.

1.5 Tools required

It is recommended that the below list of tools be used when installing the integrated roof kit.

- 2 people required for installation
- Measuring tape
- Hammer
- Drill
- Adjustable pliers
- TX 25 x 25mm torque bit
- Spirit level
- Plumb line
- Additional wood (as required)
- Pop-rivet gun

In addition to the above tools it may be required to wear suitable safety gloves upon installation as the kit consists of sheet metal which may cause cuts if care is not taken during handling of the product.

1.6 Earthing and Lightning Protection

If a lightning arrester is available, the collector frame should be connected to it. This may be performed using the collector frame, because the slot for mounting on the reverse side of the collector is ideally suited for fixing a thick cable. If no arrester is available, the potential equalization is carried out using a connection of a cable at the pipe(s) which are led into the building. Please consult local regulations to ensure adherence.

1.7 Pipe Work

The pipe work from the collector to the pump unit and from the pump unit to the cylinder is to be all metal. The joints have to be high temperature resistant (compression or high temperature flat seal). For more information please see Technical Manual.

The connections of a mounted solar collector/collector array may become excessively hot so care must be taken to avoid burns when working around collectors that are exposed to the rays of the sun.

2 Scope of delivery

Please check the contents and the condition of your delivery before signing the delivery documentation against the content shown in Table 3 and mark as appropriate. Contact your supplier immediately for any missing or damaged parts. Claims for missing or damaged parts after signing for the delivery documentation will not be accepted.

These mounting instructions only apply to the installation of the in roof flashing and the fixation of the collectors!

3 Product features and descriptions

The Dimplex Slate Integrated Roof kit offers a unique solution for mounting solar thermal collectors to the roof of a building. The concept of the product is to make the installation of the collectors a quick and simple process.

The Slate Integrated Roof Kit can cater for 2m² up to 8m² of collector area and comes in three variations, 2m² kit, 4m² kit and extension kit.

The product consists of various aluminium flashings and fixings that seal the collector against the roof covering in an aesthetically pleasing way. The collector is an integral part of the assembly and forms part of the weather tightness of the roof.

4 Collector connections

Due to its four connections, the collector offers a wide choice of connection options. Ensure that no part of the collector array or collector in the array is short circuited by following these instructions.

When planning the collector array, the position of the various connection parts must be in accordance with the diagrams, also pay attention to the position of the highlighted sensor pocket position.

Table 8 illustrates the components required to make all the collector connections.

Part No	Image	Description
P01		22mm x 90° elbow
P02		22mm stop end
P03		22mm x 22mm straight compression

Table 8: Collector connection components

4.1 Single collector portrait connection

When installing a single collector installation, there is one connection option available. The sensor must always be installed at the top of the collector and on the connection where the heat transfer fluid leaves the collector.

Figure 2 illustrates the left hand side connection option that is applicable only to a single portrait collector connection.

Figure 2: Left hand side connection option for single collector only

4.2 Multiple collector portrait connection

When installing multiple collectors, (2 up to 4), component P03 is used to connect one collector to the next.

Figure 3: Multiple collector portrait connection

The sensor must always be installed at the top of the collector on the connection flow of the system.

Installation

NB: Ensure all the laths / roof battens under the area of the installation are in good condition. Replace any damaged, weak or broken laths and double nail or screw to the rafters.

Figure 4: Mounted dimensions

Step: 1

For the stabilisation of the front parts mount an additional roof batten as shown in Step 1 and 2.

Step: 2

Step: 3

Step: 14

Step: 15

Step: 16

Step: 17

Step: 18

Place 4 centre fixation brackets to the collector as shown in Step 19. Fix every bracket with 2 No. 5x30mm wood screws.

Step: 19

Step: 20

Step: 21

Step: 22

Step: 23

Step: 24

Step: 27

Repeat steps 20 to 24

Step: 28

Step: 31**Step: 32**

Step: 39

Step: 40

Step: 43

Mount the centre collector cover and fit into the collector profile as shown in Step 41 and 44.

**Important!**

Always check that the opening on the cover fits the ventilation opening of the collector. See Step 41a.

Important!

Check the engraved number on the cover.
Cover for left collector: 74001
Cover for centre collector: 74002
Cover for right collector: 74003

Step: 44

Step: 45

Mount the right collector cover following the same procedure as for the left and centre cover

Important!
Always check that the opening on the cover fits the ventilation opening of the collector. See Step 41a.

Important!
Check the engraved number on the cover.
Cover for left collector: 74001
Cover for centre collector: 74002
Cover for right collector: 74003

Step: 46

Mount the collection strips between the collectors.

Just plug them into the collector profiles as shown in Step 47.

You can use the connection strips in both directions (there is no upper or lower side).

Important!
Before fitting insulate pipes and connections

Step: 79

Step: 80

Step: 81

Fix every back part connection
with 4 No. sealing screws.

Step: 82

Step: 83

5 Operation & Maintenance

Connections should be double checked prior to commissioning of the system. Please refer to the On Site Guide for guidance on how to commission and operate the solar system.

Risk of scalding! Before carrying out any maintenance work on the system ensure that it is safe to do so. The solar system must be decommissioned before work can be carried out. Refer to the On Site Guide for a maintenance schedule of the complete system. Check for leaks at the collector connections and other connections in the system. Also ensure pipe insulation is intact and in good condition.

6 Spare Parts

7 Decommissioning

Risk of scalding! Before carrying out any decommissioning work on the integrated roof kit, please ensure the solar system has been decommissioned.

If the product is being recycled, local waste disposal laws must be adhered to.
